

Campaign Coverage Reconciliation and GPS-Derived Visit Evidence

Technical evidence map | baseline_30m visit classification | 9-13 March 2026

Observed evidence classes

- GPS + e-tally: corroborated visit
- GPS visit; no e-tally report
- ▲ No GPS visit evidence; e-tally reported
- No GPS or e-tally visit evidence
- ◆ Ambiguous GPS attribution
- × Inaccessible settlement

Interpretation

Symbols show observed evidence, not proof of service delivery or non-performance.

GPS-unvisited means no confirmed GPS visit evidence under the baseline method; it does not establish that a settlement was genuinely missed.

Global spatial statistic

Primary k=8 Global Moran's I = 0.046612
Expected I = -0.000420 | z = 4.821064
999 permutations | p = 0.001

Local Moran interpretation

Exploratory screening patterns are not statistically significant after FDR correction. No confirmed local hotspots are shown or inferred.

Uncertainty and decision use

Absence of GPS evidence is not evidence of operational failure. Potential causes include logger non-use or failure, signal loss, attribution uncertainty, timing or identifier mismatch, and processing limitations. Prioritize rapid verification before assuming non-performance.
